Deriving the OLS (Ordinary Least Squares) estimated coefficients:

$$(1) \quad Y_t = a + bX_t + e_t$$

$$(2) \quad \bar{Y} = a + b\bar{X}$$

$$\therefore Y_t - \bar{Y} = b(X_t - \bar{X}) + e_t$$

$$(3) \quad y_t = bx_t + e_t$$

- the sum of the errors is zero
- a bar (i.e. \bar{X}) over a variable signifies the mean
- subtract the means (2) from each value (1)
- rename the deviations from the mean with lower case letters (3) $e_t = y_t - bx_t$

Goal: find the \hat{b} that minimizes the sum of the squared error terms, $\sum e_t^2$.

$$e_t = y_t - bx_t$$

$$e_t^2 = y_t^2 - 2by_tx_t + b^2x_t^2$$

$$\sum e_t^2 = \sum y_t^2 - 2b \sum y_tx_t + b^2 \sum x_t^2$$

$$\frac{\partial \sum e_t^2}{\partial b} = -2 \sum y_tx_t + 2b \sum x_t^2$$

$$= 0 \Rightarrow \hat{b} = \frac{\sum y_tx_t}{\sum x_t^2}$$

Note that upper-case letters represent the variable and that lower-case letters represent the variable less its mean.

Common Statistical Expressions:

$$\text{Variance of } x: \sigma_x^2 = \frac{\sum x_t^2}{n}$$

$$\text{Variance of } y: \sigma_y^2 = \frac{\sum y_t^2}{n}$$

$$\text{Covariance of } x \text{ and } y: \sigma_{xy}^2 = \frac{\sum x_t y_t}{n}$$

$$\text{Correlation coefficient for } x \text{ and } y: \rho_{xy} = \frac{\sqrt{\sigma_{xy}^2}}{\sqrt{\sigma_x \sigma_y}}$$

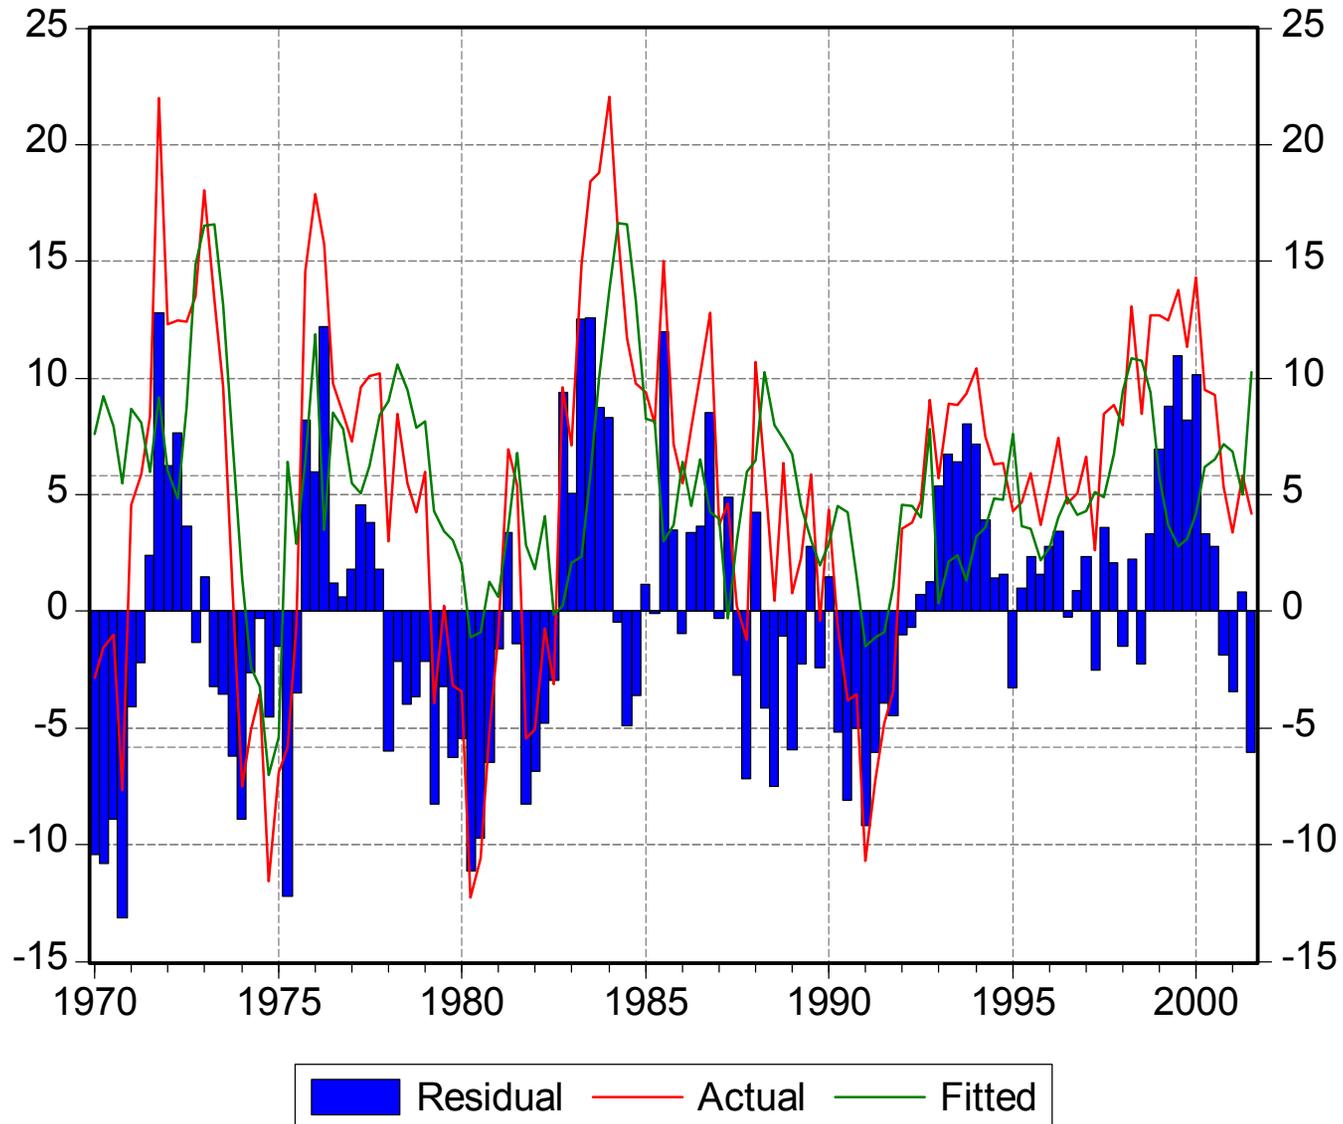

Relating these expressions to the OLS estimated coefficient, \hat{b} :

$$\hat{b} = \frac{\sigma_{xy}^2}{\sigma_x^2} = \frac{\rho^2 \sigma_x \sigma_y}{\sigma_x^2} = \rho^2 \frac{\sigma_y}{\sigma_x}$$
